Neural Networks Assignment2

Name: Anjani Priya Marthati

ID:700739769

```
In [5]: 🔰 1 #1.A Write a program that takes two strings from the user: first_name, Last_name. Pass these variables to
             2 #fullname function that should return the (full name).
              3 #o For example:
             4 #* First_name = "your first name", Last_name = "your Last name"
             5 #* Full_name = "your full name"
             7 def fullname(first_name, last_name):
8 return first_name + " " + last_name
             9 first_name = input("Enter your first name: ")
             10 last_name = input("Enter your last name: ")
             full_name = fullname(first_name, last_name)
             12 print("Full Name:", full_name)
            Enter your first name: Good
            Enter your last name: Evening
            Full Name: Good Evening
In [5]: 🔰 1 #1.8 Write function named "string_alternative" that returns every other char in the full_name string.
              2 #Str = "Good evening"
              3 #Output: Go vnn
             5 def fullname(first_name, last_name):
6    return first_name + " " + last_name
              7 def string_alternative(full_name):
                  return full_name[::2]
             9 first_name = input("Enter your first name: ")
             10 last_name = input("Enter your last name: ")
             11 result = string_alternative(full_name)
             12 print("Full Name:", full_name)
            13 print("Every Other Character in Full Name:", result)
            Enter your first name: Good
            Enter your last name: Evening
            Full Name: Good Evening
            Every Other Character in Full Name: Go vnn
```

```
In [14]: N | 1 #2. Write a python program to find the wordcount in a file (input.txt) for each line and then print the output.
              2 #o Finally store the output in output.txt file.
              4 | source_file_path = 'C:/Neural Networks/input.txt'
              5 | destination_file_path = 'C:/Neural Networks/output.txt'
              7 with open(source_file_path, 'r') as source_file:
                        lines = source_file.readlines()
                        word_counts_per_line = [len(line.split()) for line in lines]
             11 with open(destination_file_path, 'w') as destination_file:
                   destination file.writelines(lines)
             12
             13
                     for line_num, word_count in enumerate(word_counts_per_line, start=1):
             14
                        destination_file.write(f"\nLine {line_num} Word Count: {word_count}")
             15 print(f"Content from '{source_file_path}' has been written to '{destination_file_path}'.")
             Content from 'C:/Neural Networks/input.txt' has been written to 'C:/Neural Networks/output.txt'.
 In [1]: N 1 #3.Write a program, which reads heights (inches.) of customers into a list and convert these
              2 #heights to centimeters in a separate list using:
              3 #1) Nested Interactive Loop.
              4 #2) List comprehensions
              5 #Example: L1: [150,155, 145, 148]
              6 #Output: [381.0, 393.7, 368.3, 375.92]
             8 def inches_to_cm(height_in_inches):
             9 return height_in_inches * 2.54
             10 num_customers = int(input("Enter the number of customers: "))
             11 heights_in_inches = [float(height) for height in input("Enter heights in inches (comma-separated): ").split(',')]
             12
             13 heights_in_centimeters = []
             14 for height in heights_in_inches:
             15 height_cm = inches_to_cm(height)
                   heights_in_centimeters.append(height_cm)
             16
             17 | print("Heights in centimeters:", heights_in_centimeters)
            Enter the number of customers: 4
            Enter heights in inches (comma-separated): 150,155,145,148
            Heights in centimeters: [381.0, 393.7, 368.3, 375.92]
```
